

Founded in 1993, the Cyclic Vomiting Syndrome Association (CVSA) raises awareness and provides education and support to those affected by cyclic vomiting, abdominal migraine, and related disorders while advocating for and funding research.

Retired Professor of  
Psychiatry and Behavioral Sciences Northwestern  
University Feinberg School of Medicine  
Neurointestinal & Motility Program

**Thangam Venkatesan, M.D.**  
Professor of Medicine, Director of Neurogastroenterology and  
Motility, Department of Internal Medicine  
Ohio State University College of Medicine

# Cyclic Vomiting Syndrome

## Do you know someone who has unexplained, severe, stereotypic episodes of vomiting?

## Is the person well between episodes?

# Cyclic Vomiting Syndrome

## What Is It?

CVS is an unexplained disorder in children and adults that was first described by Dr. Samuel Gee in 1882. The condition is characterized by recurrent, prolonged attacks of severe nausea, vomiting, and prostration with no apparent cause. In some, there is severe abdominal pain. Vomiting occurs at frequent intervals for hours or days (1-4 most commonly). The episodes tend to be similar to each other in symptoms and duration and are self-limited with the return of normal health between episodes.

## Occurrence

CVS begins at any age. It can persist for months, years, or decades. Episodes may recur several times a month or several times a year. Females are affected slightly more than males. The person may be prone to motion sickness, and there is often a family history of migraine. There is a high likelihood that children's episodes will be replaced by migraine headaches during late adolescence.

## Symptoms

Episodes may begin at any time but often start during the early morning hours. There is relentless nausea with repeated bouts of vomiting or retching. The person is pale, listless, and resists talking. They often drool or spit and have extreme thirst. They may experience intense abdominal pain and less often headache, low-grade fever, and diarrhea. Prolonged vomiting may cause mild bleeding from irritation of the esophagus. One mother aptly described her child's state during the episode as a 'conscious coma'. The symptoms are frightening to the person and family and can be life-threatening if delayed treatment leads to dehydration.

## Diagnosis

CVS has been difficult to diagnose because it is infrequently recognized and is often misdiagnosed as stomach flu or food poisoning. There are currently no blood tests, x-rays, or other specific procedures used to diagnose the disorder. The diagnosis is made by careful review of the patient's history, physical examination, and lab studies to rule out other diseases that may cause vomiting similar to CVS.

## Triggers

Although some patients know of nothing that triggers attacks, many identify specific circumstances that seem to bring on their episodes. Colds, flus and other infections, intense excitement (birthdays, holidays, vacations), emotional stress, and menstrual periods are the most frequently reported triggers. Specific foods or anesthetics may also play a role.

## Treatment

Treatment is generally supportive with much importance placed on early intervention. A dark quiet environment is critical for sleep. Hospitalizations and IV fluid replacement may be necessary. Medication trials often succeed in finding something to prevent, shorten or abort episodes. Links have been made between CVS and mitochondrial disease supporting the use of CoQ10, L-Carnitine, and other supplements can be beneficial. It is important to work with a physician who does his/her best to understand CVS and is supportive.

## Long-Term Treatment

The foundation of long-term management involves a responsive collaborative doctor-patient-family relationship, sensitive to stresses caused by the illness and to triggers such as feelings and attitudes that may predispose individuals to attacks. Consistent, accessible physician care by a care coordinator who understands and communicates the nature of CVS, regardless of specialty, is vital to the family's well-being. Connections with the Cyclic Vomiting Syndrome Association, a family and professional network, does a great deal toward healing a family that has been in doubt and despair for years.
